                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
cytochrome c, testis-specific [validated] - mouse

NyAlternate names: cytochrome c T

NyAlternate names: cytochrome c T

Syspecies: Mus musculus (house mouse)

C;Species: Mus musculus (house mouse)

C;Date: 24-Apr-1984 #sequence revision 30-Sep-1991 #text_change 31-Dec-2004

C;Accession: B28160, A00012; I48313

R;Virbasius, J.V.; Scarpulla, R.C.

J. Biol. Chem. 265, 6791-6796, 1988

A;Title: Structure and expression of rodent genes encoding the testis-specific cytochrom A;Reference number: A28160; MuID:88198250; PMID:2834389

A;Accession: B28160.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            erentiation.

C,Superfamily: cytochrome c/cytochrome c2; cytochrome c homology
C,Superfamily: cytochrome c/cytochrome c2; cytochrome c homology
C,Keywords: blocked amino end; chromoprotein; electron transfer; heme; iron; metalloprot
E;2-99/Domain: cytochrome c, testis-specific #status experimental <MAT>
E;2-99/Domain: cytochrome c homology cYC>
E;2-Modified site: blocked amino end (Gly) (in mature form) (probably acetylated) #statu
F;15,18/Binding site: heme (Cys) (covalent) #status experimental
F;19,81/Binding site: heme iron (His, Met) (axial ligands) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               t,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytochrome c, testis-specific - rat
C;Species: Rattus norregicus (Norway rat)
C;Date: 30-Sep-1991 #sequence_revision 30-Sep-1991 #text_change 31-Dec-2004
C;Accession: A28160

-!- FUNCTION: Tubulin is the major constituent of microtubules. It binds two modes of GTP, one at an exchangeable site on the beta chain and one at a nonexchangeable site on the alpha-chain.
-!- SUBUNIT: Dimer of alpha and beta chains.
-!- SIMILARITY: Belongs to the tubulin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Blepharisma japonicum.

NUCLEOLIDE SEQUENCE.

NUCLEOLIDE SEQUENCE.

Ribosomal and chromosomal protein cDNA clones of Xenopus laevis ribosomal and chromosomal protein cDNA clones of Xenopus laevis thymus isolated with differential screening.";

L Comp. Biochem. Physiol. 981.27-133(1991).

C --- SIMILARITY: Belongs to the ribosomal protein S13P family.

PIR. CG1510; CG1310; CG1310.

```
Dibasic endoprotesses of the invention are localised to the endoplasmic reticulum of yeast host cells via ER-retention signals. A preferred retention signal is the terrapeptide XDEL functional in mammalian cells. See also AAQ42671, AAQ42672 and AAA41971-2. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                  Endoplasmic reticulum-located recombinant di:basic endoprotease - u
host cells to raise ratio of active, correctly folded heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single chain antibody; sFv; heavy chain; light chain; kappa; variable domain; hydrophilic linker; antibodies; endoplasmic reticulum retention.

The antibody is esp. a single chain antibody in which the heavy and light chain variable regions are joined via a hydrophilic linker peptide. Localisation sequences are pref. included in the constructs. See AAR48246 9 and AAR48252-3 for pref. (Known) endoplasmic reticulum retention signals. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR49291-505 and AAR46981-7038 represent peptide fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MHC) class II allotype. These peptides may be used for therapy of autoimmune diseases, such as type I diaberes, rheumatoid arthritis and mutiple sclerosis, and to reduce transplant rejection. They may also be used for vaccination providing an exclusively
                                                                                               comprise a sequence adapted for intracellular delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Naturally-occuring, immunomodulatory protein; human; therapy; class I; major histocompatibility complex; class II; allotype; type I diabetes; autoimmune disease; rheumatoid arthritis; T-cell-mediated response;
             binding of antigens - by using antibody targetting with for e.g. tumour suppression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A trafficking sequence is an AA sequence which functions to control intracellular trafficking (directed movement from organelle to organelle or to the cell surface) of a polypeptide to which it is attached. Such trafficking sequences might traffic the polypeptide to ER, a lysosome, an endosome, and include signal peptides, ER retention peptides such as ARA49581, and lysosome-trargeting peptides such as ARA49585 and ARA49586. An example of a signal peptide with such a function is the signal peptide of MHC class II alpha (AAR49587). (Updated on 25-MAR-2003 to correct PN

A transgenic plant comprising or expressing a DNA sequence encoding an immunogenic agent can be be used as an oral vaccine for animals. The vaccine is administered by the oral consumption of the plant and provides the first known functional method for immunising animals using transgenic plants, where the plants express bacterial antigens that act as both immunogens and adjuvants. The method provides an inexpensive production and delivery system for such antigens to animals. This sequence acts as an dicrosomal retention signal and was used to animist. This sequence acts as coli toxin subunit C-terminal sequence. The sequence coding for the whole LT-B gene was used in the construction of such a transgenic plant. The submunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B subunit) or optionally LT-A or CT-A
                                                                                                                                                                                                Transgenic plants contg. E. coli heat labile enterotoxin subunits - used as oral vaccines for animals which consume the plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody, fusion protein, single chain; inhibition; tumour; diagnosis; detection; imaging; immunotoxin; targetting; assay; immunoassay;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Endoplasmic reticulum retention signals include a mammalian signal (AAR95063), a bacterial signal (AAT05064) from Pseudomonas exotoxin, and a yeast signal (AAR95065). The signal may form part of a multidomain protein (see also AAR95053-58) that is used with an effector nucleic acid for the transfer of nucleic acids to targeted cells as a means of gene therapy. The endoplasmic reticulum retention signal functions to affect intracellular routing of the internalized protein/nucleic acid complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Toxin; subunit; vaccine; transgenic plant; immunogen; antigen; adjuvant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid transfer system for gene therapy, e.g. against cancer -

```
A novel recombinant DNA molecule which encodes a single chain fusion protein or antibody comprising the Fv region of both the light and heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion protein or Ab has the binding specificity of monoclonal Ab (MAb) B1, B3 or B5, can be used for the production of such fusion proteins or antibodies. The fusion proteins can be used in compositions as an immunotoxin to inhibit tumour cell growth. The single chain antibody can be used to detect the presence or absence of cells bearing a lewis(Y) carbohydrate antigen in a patient. The antibodies are also useful as multiple targetring moieties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the imaging of tumours when attached to a radiolabel and for the pathological diagnosis of tumours. Humanised antibodies are less and in the imaging of tumours when attached to a radiolabel and for the pathological diagnosis of tumours. Humanised antibodies are less
                                                                                                                                                                                                                                                                                                                                                                                                          immunogenic than the mouse MADS B1, B3 and B5, making them more suitable for long term treatment. The effector molecule used is preferably a drug or cytotoxin which then produces an immunotoxin capable of selectively killing particular cells. Preferred toxins are the Pseudomonas exotoxin or Diphtheria toxin. These are both highly toxic compounds and so are modified to eliminate domain Ia of the Pseudomonas toxin, various amino acid deletions in domains II and III, single amino acid substitutions and addition of one or more sequences at the C-terminal end. The wild type C-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR; primer; amplify; polymerase chain reaction; antibody; immunotoxin; variable heavy chain; VH; murine monoclonal antibody; Lewisy; carcinoma; carbohydrate antigen; Pseudomonas exotoxin; proteolytic activation; cytotoxic activity; tumnour; autoimmune condition; rheumatoid arthritis; graft versus host disease; orationsplant rejection; type I diabetes; multiple sclerosis; systemic lupus erythematosus; myasthenia gravis; T cell; B cell; cytosol; bone marrow; transplant; therapy.

AAW21967-W21969 represent linkers used in the immunotoxins of the invention. The immunotoxins bind to target cells, and comprise, a pseudomonas exotoxin (PB) that does not need proteclytic activation for cyclotoxic activity fused to a VH framework region of an FV antibody (Ab) fragment. The VH chain region is bound through at least one disulphide cond or a variable light (VL) chain framework region. The PB is lacking cresidues 1-279 and is at least 10-fold more cyclotoxic to the target cells than an immunotoxin comprising PE attached to a VH chain framework region. These sequences are used to join the VH chain framework region. These sequences are used to join the VH chain framework credion. These sequences are used to join the VH chain region to the PE. The immunotoxins can be used for killing target cells in the treatment of transplant rejection, type I diabetes, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus, myasthenia gravis, etc, all caused by T and B cells. They can also be used to deliver an antibody to the cytosol of a cell, and in vitro in the elimination of harmful cells from bone marrow before transplant. The immunotoxins have high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This sequence represents a endoplasmic reticulum retention peptide, and can be used in the method of the invention. The method is for producing an RNA-loaded antigen presenting cell (APC) that presents on its surface a tumour or pathogen antigenic epitope (TAE or PAE respectively) that induces T cell proliferation and an immune response against the tumour or pathogen, and comprises introducing into an APC in vitro, RNA that encodes the antigen. The RNA-loaded APCs can be used to stimulate cytotoxic T lymphocyte (CTL) proliferation ex vivo or in vivo. The ex vivo expanded CTL can be administered to a patient in a method of adoptive immunotherapy. The methods can be used for treating or adoptive immunotherapy. The methods can be used for treating or bepatitis influenza, poliomyelitis, measies, herpes, mumps or rubella viruses, Salmonella, Shigella or Enterobacter. The method circumvents the need to purify RNA or isolate and identify a TAE or PAE Sequence 4 AA; X88888888888888888888888888888888888

Plasmid encoding immunogenic target protein - used in, e.g. protective or therapeutic vaccines against allergy, cancer, microbial infection or auto Claim 7; Page 62; 84pp; English. -immune disease.

This peptide, when joined to the C-terminus of a protein, acts as an endoplasmic reticulum (ER) recycling signal that localises the protein from the Golgi body back to the ER when expressed in a cell. A claimed novel plasmid comprises a sequence, linked to regulatory elements, that encodes an immunogenic target protein that includes, or is linked to, an intracellular targeting sequence (ITS) such as this peptide. Other ITS peptides (see AMWS5612 and AAWS6514) are provided that direct localisation in the lysosome or the ER. The novel plasmid is used as a protective or therapeutic DNA vaccine to immunise against the immunogenic target protein (claimed), particularly in cases of allergy, cancer (or

ö autoinmune disease, e.g. rheumatoid arthritis, insulin-dependent diabetes mellitus, Crohn's disease, asthma, pernicious anaemia and many others. A particular use is against pathogens that, at least for part of their life cycle, are intracellular, e.g. hepatitis C, HIV, Neisseria gonorrhoeae, Listeria and Shigella. The cytotoxic T cell response is enhanced by delivering the immunogenic target protein to the ER proliferative diseases such as psoriasis), microbial infection Gaps ô h Similarity 100.0%; Pred. Delivering compounds to cells as new conjugate with detoxified exotoxin A - able to cross membranes and deliver to the cytoplasm, e.g. nucleic acids, antibodies, tumour suppressors etc.

Disclosure; Page 8; 76pp; English.

recurring back to the endoplasmic reticulum (ER) proteins that used for reticulum and back to the endoplasmic reticulum (ER) proteins that have seached the ER and entered to Golgi complex. The mechanism involves the KDEL receptor. The KDEL motif can replace a REDL motif (see AAW76395) present at the C-terminal end of Pseudomonas servaginoss excotain A (ETA, see AAW76391). This motif is important in the intracellular transport and cytotoxicity of ETA. This suggests that ETA interacts with the KDEL receptor and that ETA may reach the interior of the EF before penetrating the cytosol. The involution provides a means of delivering compounds to the cytosol. The involution provides a means of delivering compounds to cells as conjugates with modified ETA. The modified ETA is able to cross membranes and deliver e.g. therapeutic agents to the cytoplasm, such as nucleic acids, peptides, peptide nucleic acids, single chain antibodies This peptide is the consensus intracellular transport signal used and tumour suppressors

This sequence represents an endomembrane retention signal which is used in a method involving the construction of a target molecule from human J chain protein fragments. This construct is used in a method to target magning agents to epithelial surfaces at which they may remain or undergot transepithelial transport via transcytosis. At least one imaging agent is linked to the targeting molecule comprising a polypeptide that (a) forms a closed covalent loop, (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character and (c) is not full length dimeric Igh. The imaging agents are useful in the diagnosis of disease. The target molecule is also capable of specifically binding to a basolateral factor associated with an epithelial surface to cause internalisation of a biological agent field)
Target, imaging agent, epithelium; transepithelial transport, diagnosis,
transcytosis, disease, basolateral; internalisation, J chain.
                                                                                                                                                                                                                                                                                                                                                   New epithelial tissue targetting agent - used to deliver imaging agents to an epithelial surface for internalisation; useful in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a C-terminal fragment of a Pseudomonas exotoxin (PE). This sequence can be used in the method of the invention for killing a target cell, which comprises contacting the cell with a recombinant Pseudomonas exotoxin (PE) having: (a) a recognition molecule that binds to the target cell and is inserted in domain III after amino acid 600 and before amino acid 613 of the PE, and (b) a carboxy-terminal sequence of 4-16 amino acids that permits translocation of the PE into the cytosol of the target cell. The insertion of a recognition molecule allows selective killing of target cells without significant cytotoxicity to other cells not recognised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for killing target cells - with recombinant Pseudomonas exotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The endomembrane retention signal is used in the synthesis of a targeting
                                                                                                                                                                                      and a DNA sequence encoding a secreted glycosyltransferase that lacks the membrane anchor and the Golgi retention signal. The glycosyltransferases are used in anzymatic oligosaccharide synthesis. They are produced in a soluble form that is secreted into the culture medium without loss of enzymatic activity, resulting in increased production and simpler recovery (free of any membrane-bound glycosyl-transferase), compared with extraction from mammalian tissue. The present sequence represents a carboxy-terminal sequence sufficient for retention of a protein in the endoplasmic reticulum
                                                                                                        Expression cassette for producing glycosyltransferase in secretable form - lacking membrane anchor and Golgi retention signal, used for synthesis
                                                                                                                                                                               The invention relates to expression cassettes which contain a promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to deliver biologically internalisation.

The invention relates to a water soluble polysaccharide with a molecular weight greater than 1000 Daltons covalently attached to (a) at least one chelating moiety selective for a monovalent or divalent metal ion (to act as a fluorescent indicator for the metal ion) and (b) at least one targeting peptide (to localise the compound to the inside of a cellular organelle). Preferzbly the polysaccharide is dextran, ficel, heparin, allocatiar amylopectin, mannan, inulin, starch, agarose or cellulose with the Lit, Cast or Mg2+. The compounds are useful for analysing intracellular ion levels, especially Ca2+. The present sequence represents a cellular ion levels sepecially Ca2+. The present sequence carboxyl terminal sequence commonly shared by localisation peptides for the endoplasmic reticulum (ER)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
molecule (TW). The TMS are used to target biological agents to epithelial surfaces at which they can be internalised. The TMS comprise a polypeptide that: (a) forms a closed covalant loop; (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character; and (c) is not full length dimeric IgA. The TMS are useful to prevent and/or treat diseases associated with epithelial surfaces, e.g. asthma, cancer, (wyco)bacterial, viral or fungal infection, inflammatory disorders, autoimmune disorders, celiac disease, collits, pneumonia and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bifunctional chelating polysaccharides used for analysing intracellular ion levels - have chelating moieties attached which act as a fluorescent indicator in the presence of selected metal ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bifunctional chelating polysaccharide; targeting peptide; heparin; nuclear localisation; fluorescent indicator; dextran; ficol; glycogen; amylopectin; mannan; inulin; starch; agarose; cellulose; ER;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a peptide that can be added to the C-terminal end of a Pseudomonas exotoxin (PE) to produce a modified PE. Claimed immunoconjugates comprise a therapeutic agent, such as PE or a cytotoxic fragment of PE, and an anti-mesothelin antibody, such as scFv SS (see ABB76197), and are obtained by recombinant methods. The recombinant immunoconjugates are used in a claimed method for inhibiting the growth of a malignant cell that expresses mesothelin on its cell surface, especially in mesothelioma, ovarian cancer, stomach cancer or squamous
